

One Platform for the Entire Interior Project

From requirements to installed rooms — a persistent, collaborative, explainable-AI platform. The five-screen design journey is the heart of the product, and it now lives inside a Project: versioned, multi-user, and connected to a real marketplace, real suppliers, and real installation on site.

01 · BRIEF

AI Requirement Collection

A resumable 12-step conversational intake that captures the full design brief — with editable, confidence-scored data.

02 · LAYOUT

AI Space Planning

Optimized, versioned 2D layouts scored on movement, light, privacy and Vastu — every score explainable on click.

03 · VISUALIZE

AI 3D Interior Design

Photorealistic, editable renders with SKU-linked materials, live cost deltas, per-room approval, and AR/VR.

04 · ESTIMATE

AI BOQ & Cost Estimate

A derived, always-recalculated Bill of Quantities with Economy / Standard / Premium tiers and contractor exports.

05 · PROCURE

Shopping, Order & Install

A ready-to-buy cart with live stock, lead times, EMI, install scheduling — flowing straight into order tracking.

WHAT MAKES THIS A PLATFORM, NOT A WIZARD

Every design journey runs inside a **persistent Project** with its own timeline, files, versions, team, comments and approvals. Four roles — homeowner, architect/designer, contractor and supplier — work in the same shell. A **Trust Layer** runs underneath everything: every AI output carries a confidence score, a plain-language reason, its tradeoffs, and its cost and timeline impact. Nothing the AI produces is a bare number or an unexplained image.

REFERENCE PROJECT — USED THROUGHOUT

Project	3BHK Apartment	Budget	Rs 12,00,000
Area	1,450 sq.ft.	AI Estimate	Rs 11,87,900
Family	4 Members + Pet	Status	Within Budget
Style	Modern Minimal	Savings	Rs 62,100 (5.2%)

All figures in this document belong to one continuous project so that every screen, version, comment and order can be traced end to end.

The Platform: Projects, Design Studio & Roles

Projects are first-class objects. The design journey is a module inside them, not the whole product.

OVERVIEW

Real interior projects are collaborative, revised repeatedly, and span months — so the platform is organised around a **Project**, not a session. The global shell contains **Home, Projects, Marketplace, Orders, Vendor Hub and Settings**. Opening a Project reveals its own workspace: **Overview, Design Studio, Timeline, Approvals, Files & Versions, and Team & Comments**.

The five design screens become the **Design Studio** — five persistent, versioned tabs (**Brief · Layout · Visualize · Estimate · Procure**) that can be revisited and edited at any time. A customer who closes the app mid-brief resumes exactly where they left off; a customer who finished months ago reopens the same project to reorder a damaged panel. The Marketplace stays deliberately decoupled, so returning customers can browse and reorder without re-running the AI flow.

PROJECT HOME

Each project opens on a dashboard: current design version, budget vs. estimate, open comments and pending approvals, order status, and the auto-generated **Timeline** from brief to installation. Uploaded floor plans, renders, exports and invoices all live in **Files & Versions**. One household can run **multiple properties** as separate projects under one account.

WHY IT MATTERS

A one-way wizard optimises a single happy path and loses the customer the moment life interrupts. Persistent projects capture the real, months-long shape of interior work — and every return visit is another marketplace opportunity.

ONE SHELL, FOUR ROLES

All four personas log into the same application; the sidebar reconfigures by role instead of shipping separate products.

ROLE	PRIMARY DESTINATION	UNIQUE MODULES
Homeowner	Home → Projects	Design Studio, financing, installation booking
Architect / Designer	Projects (multi-client)	Client management, design override tools, white-label export
Contractor / Builder	Vendor Hub	BOQ execution view, labour scheduling, site progress photos
Material Supplier	Vendor Hub	Inventory sync, order queue, pricing management

FIVE FLOWS THE PLATFORM SUPPORTS

- **New project** — Sign up → Brief → AI layout options → Visualize → Estimate → Procure → Timeline auto-created. The primary conversion path.
- **Revision after approval** — Request a change → AI shows a diff with cost and timeline impact → approve → a new version is created, the old one preserved, and downstream screens are flagged out-of-sync.
- **Collaboration** — Owner invites an architect with edit rights on Layout and Visualize; comment threads and a required approval gate Procure.
- **Contractor execution** — The Estimate becomes a task list; site progress is logged and visible to the homeowner in real time.
- **Supplier fulfilment** — Orders route by SKU and region; the supplier confirms stock and installation auto-schedules against the Timeline.

Every AI output ships with its confidence, its reasoning, its tradeoffs, and its cost and timeline impact.

OVERVIEW

This product handles money and structural decisions, so it must feel closer to a financial dashboard than a mood board. The rule is simple: **never a bare number, never an unexplained image**. Every AI result appears with a one-line "why" the moment it appears, and full reasoning one click away. Default views stay simple; density is available on demand — a toggle, not a separate screen.

THE COMMON AI ENVELOPE

Explainability is structural, not a UI afterthought. Every AI service — brief parsing, layout solving, rendering, estimation, product matching — returns the same envelope:

```
{ result, confidence, reasoning[ ], tradeoffs[ ],  
  cost_impact, timeline_impact, alternatives[ ] }
```

Because the envelope is uniform, the same trust components work identically in Layout, Visualize and Estimate — the AI feels like one system, not five bolted-on features.

AI SAFETY & GUARDRAILS

- Anything the AI has **assumed** rather than confirmed — a load-bearing wall, a plumbing line, a beam — is visibly flagged "assumed" and excluded from purchase-critical calculations until confirmed.
- Layout changes that touch structural elements require a **professional verification step** before the Estimate treats them as buildable.
- Sponsored supplier placement is **clearly labelled** and never disguised as an AI recommendation.

FOUR COMPONENTS, BUILT ONCE, USED EVERYWHERE

Confidence Chip • 92% CONFIDENT

A small pill next to any AI output. Hover reveals the reasoning and tradeoffs behind the number. Identical in Layout, Visualize and Estimate, so users learn it once.

Reasoning Drawer

A slide-out panel — What changed · Why · Cost · Timeline — used everywhere an AI decision needs inspection before or after it is made. Clicking any layout score, material choice or AI saving opens it.

Version Rail v1 → v2 → v3

A thin strip above every editable canvas — Layout, Visualize, BOQ — with diff-on-hover between versions. Nothing the AI or a user does ever destroys a previous version.

Cost Delta Badge +₹4,200

Appears live during any edit, colour-coded. A material swap or a layout change is never a silent cost change — the budget consequence is visible at the moment of decision.

WHY IT MATTERS

The single biggest reason customers abandon AI design tools is that outputs feel pre-baked and arbitrary. When every score is clickable, every saving carries a reason, and every version is preserved, the AI earns the right to sit between a family and a twelve-lakh decision.

Tell the AI about your needs. Capture a real design brief in under five minutes, without it feeling like a form.

OVERVIEW

A guided, chat-style intake wizard that walks the customer through **12 quick steps** in under five minutes. The AI assistant collects everything a human designer would ask in a first consultation: property type and areas (1,450 sq.ft. carpet / 1,650 sq.ft. built-up), rooms to design, family composition (2 adults, 1 child, 1 pet), daily lifestyle habits, preferred design style (Modern), colour and material choices, and the budget (Rs 12 Lakh on a Rs 3–50 Lakh slider). The customer can upload a floor plan (JPG/PNG/PDF), house photos and videos before the AI produces a project summary and generates the design.

The Brief is now **resumable**: every answer autosaves as a draft, and a returning customer continues exactly where they left off — including from another device, since the draft belongs to the Project, not the browser session. Households with more than one home simply create additional projects; the brief never has to be repeated for the same property.

EDITABLE, CONFIDENCE-SCORED EXTRACTION

When a floor plan is uploaded, OCR-extracted facts are not silently absorbed. Each one is shown as an **editable chip with its own confidence score** — "Living Room: 16'×14', 87% confident" — so the customer corrects the AI's reading before it drives any layout or costing. Low-confidence extractions are highlighted for review first.

MOODBOARD & STYLE INGESTION

Alongside photos, the customer can paste a **Pinterest board or moodboard URL**. The AI converts it into a style vector that it cites in later decisions — when the Visualize step picks a walnut TV panel, the reasoning can point back to the customer's own saved images.

AI Summary

Generate Design

WHAT THE AI DOES

- Converts a free-form conversation into a structured, machine-readable design brief.
- Extracts room names and dimensions from uploaded plans via OCR, exposing every fact as an editable, confidence-scored chip.
- Uses lifestyle answers (WFH, puja room, shoe storage, kids' room) to drive downstream layout decisions — and records them as constraints it can cite later.
- Distills moodboard and Pinterest imports into a style vector referenced by the Visualize step.
- Previews the full output pipeline: space planning, furniture layout, 3D design, materials, BOQ, cost estimate and shopping list.

CONNECTS TO

The confirmed brief becomes **version 1 of the Project's constraint set**. Every later screen — layout scores, material picks, BOQ quantities — traces back to a specific brief answer, which is what makes the Reasoning Drawer possible.

WHY IT MATTERS

Replaces a 1–2 hour designer consultation with a five-minute self-serve flow that qualifies leads at near-zero cost. Draft autosave rescues the large share of customers interrupted mid-intake, and confidence-scored extraction means the first

An optimized layout for movement, light and functionality — every score explainable, every edit versioned.

OVERVIEW

The AI turns the requirement brief and uploaded floor plan into an **optimized 2D layout** for the 3BHK. The dimensioned plan marks every room (Master Bedroom 13'0" × 12'0", Living 16'0" × 14'0", Kitchen with attached utility) with movement-flow arrows and the entry point. A 9-room checklist tracks completion, a 2D/3D toggle switches views, and three alternative AI-generated layouts sit one click away for comparison.

The layout is scored on five factors — movement flow, natural light, privacy, smart space utilization and Vastu — and **each score is clickable**. Clicking one opens the Reasoning Drawer with the exact rule applied: "living room placed near the entry for easy access", "bedrooms grouped in a private zone", "kitchen connected to utility for efficient workflow". Scores are never decoration; they are entry points into the AI's logic.

SAFE TO ITERATE: VERSIONS, NOT OVERWRITES

Plain-language edits ("Bigger kitchen", "Attached bathroom") and manual edits both create a **new version on the Version Rail — v1 is never destroyed**. Hovering between versions shows a visual diff, and every new version reports its cost and timeline impact before it is accepted. When a layout changes after later steps are complete, downstream screens are flagged out-of-sync rather than silently invalidated.

STRUCTURAL HONESTY

A **collision and door-swing overlay** checks that furniture, openings and circulation actually work — a wardrobe blocking a door swing is flagged before it reaches the render. Structural elements the AI inferred from the floor plan are drawn on a separate overlay marked **"assumed"** until the customer or a professional confirms them.

Clickable Score Reasoning

Version Rail & Diff

Collision / Door-Swing Check

Structural "Assumed" Overlay

Comments & Presence

WHAT THE AI DOES

- Generates the layout in seconds via a constraint-and-optimization engine, and scores it on five explainable factors.
- Offers three alternative layouts for one-click comparison, each carrying its own scores and reasoning.
- Accepts plain-language edits alongside manual editing, producing a new version with a before/after diff and cost impact.
- Runs collision and door-swing analysis on every version and flags unconfirmed structural assumptions.

COLLABORATION

An invited architect or family member can **comment directly on the plan** — comments anchor to a room or an object, not just the page. A presence dot shows when a collaborator is viewing, and their edits appear as their own versions on the rail, so parallel exploration never causes lost work.

WHY IT MATTERS

Space planning is normally the slowest, most expert-dependent phase. Automating it with scores a customer can interrogate — and edits that can never destroy previous work — turns the scariest step of the journey into the safest one, and moves the customer to visualisation immediately.

Explore your space in photorealistic 3D — with honest materials, live costs, and room-by-room approval.

OVERVIEW

The approved layout becomes a **photorealistic 3D render** the customer walks through room by room via the thumbnail carousel. Controls include rotate, pan, zoom, day/night lighting and warm/neutral/cool light, with Realistic and Wireframe modes plus Top View. **AR and VR are real toolbar entry points:** AR places chosen furniture in the customer's actual room through the phone camera, and the VR walkthrough turns the render into an immersive preview.

The right rail exposes the exact materials the AI chose — off-white wall paint, walnut TV panel, Italian marble flooring, beige linen sofa, light-grey rug, sheer curtains — and explains decisions like the warm neutral palette and the green accent chair, citing the brief and the imported moodboard.

HONEST MATERIALS, LIVE COSTS

Every visible material maps to a real product SKU, and each carries a **match-confidence label**: "exact SKU" when the render shows the shippable product, "closest match" when it approximates one. Swapping any material shows a **live Cost Delta Badge** — the budget consequence appears at the moment of the swap, never later as a surprise in the BOQ.

ROOM LOCKING & RENDER QUEUE

When a room is finished, the customer (or their designer) marks it **Locked / Approved**. Further edits require an explicit unlock, protecting sign-offs in multi-user projects. Regeneration requests join a **visible render queue** with position and time estimates — the system never appears frozen while the diffusion/3D pipeline works. Every regenerated room lands on the Version Rail alongside its predecessors.

Live Cost Delta

Material Match Confidence

Render Queue

Per-Room Lock / Approve

Version History

WHAT THE AI DOES

- Renders every room in the customer's chosen style with a consistent, SKU-linked material palette — keeping the render honest to the final estimate.
- Accepts natural-language change requests ("Add false ceiling", "Change sofa colour", "Add wooden partition") and regenerates as a new version.
- Explains every material choice — why this palette, why this finish — with references back to the brief, lifestyle answers and moodboard.
- Reprices the room live on every swap and labels each material's match confidence.

CONNECTS TO

Approved rooms feed the Estimate directly; locked rooms freeze their line items. Comments on renders carry into the Approvals tab, and shared views let a spouse or architect review from any device before sign-off.

WHY IT MATTERS

Seeing the finished home before spending a rupee is the strongest conversion moment in interior design — and because materials are SKU-linked and cost changes are visible live, the render doubles as a sales catalogue the customer already trusts. Room-level approval turns "looks nice" into a concrete, auditable sign-off.

A transparent, always-derived Bill of Quantities — priced in three tiers, honest to the last rupee.

OVERVIEW

The design decomposes into a **professional, room-wise Bill of Quantities**. The Living Room (Rs 1,85,400) itemises the TV unit, 3+2 sofa set, false ceiling (180 sq.ft. @ Rs 250), premium emulsion paint (350 sq.ft. @ Rs 35), lighting, curtains and labour; the Kitchen (Rs 2,45,600) covers the modular kitchen, quartz countertop, sink and auto-clean chimney. A cost donut splits spend across Furniture (34.7%), Material (27.1%), Labour (10.8%), Services, Electrical, Plumbing and Appliances. The Rs 11,87,900 estimate sits within the Rs 12,00,000 budget with Rs 12,100 remaining; 18% GST brings the grand total to Rs 13,80,900.

The BOQ is **derived, never hand-reconciled**: every upstream edit — a layout change, a material swap, a locked room — triggers an automatic recalculation, so the estimate can never drift out of sync with the design it prices.

THREE TIERS, VISIBLE ASSUMPTIONS

An **Economy / Standard / Premium toggle** re-prices the project instantly, category by category — the customer can hold Premium for the kitchen and Economy for the guest bedroom in the same estimate. A **5% contingency** and the **regional labour rate** appear as visible line items rather than being buried in unit rates, and every AI-found saving ships with its reasoning — never a silent number change.

EXPORTS FOR EVERY AUDIENCE

Beyond the customer-facing PDF, a **structured contractor export** carries quantities, specifications and rate breakdowns in execution-ready form — the same document a site team would otherwise rebuild by hand.

ON THIS SCREEN

WHAT THE AI DOES

- Auto-generates quantities and market rates for every line item straight from the 3D design, adjusted for regional labour pricing.
- Recalculates the whole estimate live on any edit — quantities, rates, tiers, or upstream design changes.
- Tracks the estimate against budget in real time and suggests cheaper or premium alternates on request, each with a Reasoning Drawer explaining the tradeoff.
- Compares vendor pricing per line item so the estimate reflects the best available marketplace rate, not a single catalogue.

CONNECTS TO

Approved estimates unlock Procure. For contractors, the same BOQ becomes their **execution task list** in the Vendor Hub; for the homeowner, it remains the single price truth every order is checked against.

WHY IT MATTERS

Opaque contractor quotes are the industry's biggest pain point. A BOQ that is transparent, tiered, editable — and mathematically incapable of disagreeing with

Everything for your space in one cart — with live stock, lead times, EMI and installation booked in the same flow.

OVERVIEW

The approved BOQ converts into a **ready-to-buy cart**: 48 items, 102 units, Rs 11,87,900 in total with Rs 62,100 (5.2%) of AI-found savings — each saving explained, not silently applied. Every card shows a product photo, category tag, room mapping, quantity and unit/total pricing, with wishlist and add-to-cart actions, filterable by Furniture (16), Materials (12), Decor (8), Electrical (6) and Services (6).

Every SKU now carries **live inventory status and lead time** — "In stock · ships in 4 days" — so the cart is buildable in the real world, not just on paper. An **EMI selector at cart level** converts the total into monthly instalments through financing partners, and an **installation date picker** books fitting slots that feed the Project Timeline automatically.

SUPPLIERS YOU CAN COMPARE, NOT JUST TRUST

Verified suppliers — Urban Ladder (4.5), Pepperfry (4.3), Godrej Interio (4.6), Home Centre (4.4) — list delivery windows, backed by Best Price Guarantee, Quality Assured and Secure Payments badges. When the customer taps "**Find Better Options**", the AI shows **why** each alternative wins — price, rating or delivery speed — so switching is an informed choice. Sponsored placements, where present, are clearly labelled.

One tap adds everything to cart; "Place Order" completes a secure checkout. Ordering is not a dead end: the screen's **next state is order tracking**, covered on the following page.

Order Tracking Next

WHAT THE AI DOES

- Maps every BOQ line to real, in-stock products from rated suppliers, respecting each material's match-confidence label from the Visualize step.
- Compares prices across the marketplace and surfaces budget-friendly or premium alternatives — always with the reason attached.
- Keeps quantities in sync with the BOQ, so any late design change updates the cart automatically.
- Sequences installation slots against delivery lead times so fitters never arrive before materials do.

CONNECTS TO

Placed orders route to suppliers by SKU and region in the Vendor Hub, installation bookings populate the Timeline, and the invoice lands in the Project's Files — the design journey hands off cleanly into execution.

WHY IT MATTERS

This screen closes the loop: the design journey ends in a transaction on BuildBazaarX's own marketplace, turning every AI design into GMV across

After the Order: Execution, Tracking & Installation

The order is the midpoint of the relationship, not the end. Every party sees the same live picture of the project.

OVERVIEW

Once "Place Order" is tapped, the project shifts from design to execution — and the platform stays in the loop. The **Orders** section tracks every line item from confirmation through dispatch, delivery and installation, grouped by supplier and by room. The Project **Timeline**, auto-created at checkout, sequences deliveries and installation slots so the customer sees one coherent schedule instead of six couriers' tracking pages.

SUPPLIER FULFILMENT

Orders route to suppliers **by SKU and region** in the Vendor Hub. The supplier confirms stock against their synced inventory, manages their order queue and pricing, and dispatch updates flow back to the customer automatically. When a supplier confirms a delivery date, dependent **installation slots auto-schedule** against the Timeline.

CONTRACTOR EXECUTION

A contractor who accepts the project sees the approved Estimate as a **task list** — room by room, item by item — with labour scheduling built in. Site progress photos logged from the contractor's phone appear on the homeowner's Timeline in real time, replacing the daily "what happened today?" phone call with a shared record.

SERVICE RECORDS & WARRANTY

After installation, each item's warranty, invoice and installation record stays attached to the Project permanently. A damaged panel two years later is a two-tap reorder of the exact SKU — one more reason the marketplace, not a local dealer, gets the repeat purchase.

ON THESE SCREENS

Order Tracking Delivery Windows Installation Tracking Project Timeline

Supplier Order Queue Inventory Sync BOQ Execution View

Labour Scheduling Site Progress Photos Warranty & Service Records

Milestone Payments

WHAT THE AI DOES

- Sequences deliveries and installations into a feasible schedule — flooring before furniture, electrical before false ceiling — and reflows the Timeline when a delivery slips.
- Flags at-risk items early: a lead time that now conflicts with a booked installation raises an alert with suggested alternatives from the same estimate tier.
- Summarises daily site progress for the homeowner from contractor logs and photos.

PAYMENTS THAT MATCH REALITY

Large projects pay in **milestones tied to Timeline events** — order confirmation, delivery, installation sign-off — rather than a single upfront transfer. Funds for service work release on the homeowner's confirmation, aligning incentives on both sides of the marketplace.

WHY IT MATTERS

Post-order is where interior projects traditionally collapse into WhatsApp chaos and finger-pointing. Making execution visible — one timeline, shared by homeowner, contractor and supplier — is the single largest trust upgrade the platform can offer, and it keeps every repeat purchase and service order inside BuildBazaarX.

Interior decisions are made by families and professionals together — the platform is built for that.

OVERVIEW

Every Project has a **Team**. The owner invites a spouse, an architect or a contractor with role-scoped permissions — a designer may get edit rights on Layout and Visualize but read-only access to budget details; a contractor sees the execution view and nothing upstream. Every invitation, permission change and approval is recorded in the project's audit trail.

COMMENTS THAT LIVE ON THE WORK

Comments anchor to the thing being discussed — a room on the plan, a sofa in the render, a line item in the BOQ — not to a detached chat window. Threads resolve, mention teammates, and appear in context on every version they apply to. A **presence indicator** shows who is viewing the same canvas, and simultaneous edits land as separate versions on the rail, so live collaboration never destroys work.

APPROVALS AS A GATE, NOT A FORMALITY

Procurement **unlocks only after required approvals** are given — the owner's sign-off at minimum, plus the architect's where one is attached. Per-room locks from the Visualize step roll up into the project-level approval state. When a change is requested after approval, the AI presents a **diff with cost and timeline impact**; only on acceptance does a new version supersede the approved one, with the old version and its approval preserved.

ON THESE SCREENS

Team & Roles

Granular Permissions

Anchored Comments

@Mentions

Live Presence

Approval Workflow

Change Diff — Cost & Timeline

Audit Trail

Notifications

WhatsApp & Email Alerts

WHAT THE AI DOES

- Generates the before/after diff for any revision request, quantifying cost and timeline impact so approvers decide on facts.
- Summarises long comment threads into decisions and open questions.
- Flags downstream screens out-of-sync when an upstream approval is superseded.

NOTIFICATIONS PEOPLE ACTUALLY WANT

Notifications are event-driven and role-aware: an approval request, a delivery confirmation, a comment mention, a budget threshold crossed. Customers choose channels per event type — in-app, email, or **WhatsApp**, which is the channel Indian households and contractors actually check. Digest mode batches low-priority updates; nothing critical is ever only in-app.

WHY IT MATTERS

Real projects fail in the gaps between people — an unapproved change built on site, a spouse who never saw the render, a contractor working from an outdated BOQ. Anchored comments, gated approvals and role-aware notifications close those gaps, and they are precisely the features that make architects and contractors adopt the platform rather than tolerate it.

Platform Foundations: Reach, Resilience & Insight

The capabilities that make the platform usable by every Indian household — and credible to enterprise partners.

MOBILE-FIRST, LOW-BANDWIDTH INDIA

The majority of first-time customers will arrive on a mid-range Android phone. Every screen — including the 2D plan and BOQ — has a genuine mobile layout, renders stream progressively at connection-appropriate resolution, and the Brief works fully offline: answers queue locally and sync when the connection returns, so a patchy network never costs a lead.

LANGUAGE & ACCESSIBILITY

The conversational Brief and all AI reasoning are available in **Hindi and major regional languages**, not just English — explainability that a customer cannot read is not explainability. The interface targets WCAG AA: full keyboard navigation, screen-reader labels on plans and charts, and colour choices that never encode meaning by hue alone (cost deltas pair colour with +/- symbols).

ONBOARDING BY ROLE

First-run experiences differ by persona: homeowners get a 60-second guided sample project before committing their own details; architects import an existing client project; suppliers begin with inventory sync. Empty states always propose the next action rather than presenting a blank dashboard.

DATA PRIVACY

Floor plans and home photos are sensitive by nature. They are visible only to the project team, never used to train models without explicit opt-in, and exportable or deletable by the owner at any time — stated plainly in-product, at the moment of upload.

PROJECT ANALYTICS

The Project Overview doubles as an insight surface: budget consumed vs. plan, savings realised and their reasons, schedule health, and open-risk items. For professionals, the multi-client dashboard aggregates the same signals across projects — which client is blocked on an approval, which site is behind. Savings, and in later phases carbon and maintenance analytics, give the AI a measurable, reportable value story.

ENTERPRISE & SCALE READINESS

- **Builder and developer accounts:** one master project templated across dozens of identical units, with per-unit customisation — the natural B2B expansion of the same primitives.
- **SSO and audit logs** for organisational accounts; role permissions already generalise to teams.
- **Domain-oriented services** (Project, Brief, Layout Engine, Render, Estimation, Marketplace, Collaboration, Notification) scale independently — render capacity grows without touching checkout.
- **Integrations:** calendar for installation slots, WhatsApp Business for notifications, and export paths (structured BOQ, DXF layout) into the professional tools architects already use.

WHY IT MATTERS

None of these are features a customer asks for in a demo — all of them decide whether the platform survives contact with real households, real job sites and real procurement teams. They are the difference between a product that impresses and a product that gets adopted.

Revenue and trust built from the same primitives — delivered in five phases over twelve months.

MONETIZATION

- **Marketplace take-rate on GMV** — the core engine: every AI design that converts becomes commissioned orders across furniture, materials and services.
- **Financing / EMI referral fees** from lending partners on cart-level instalment plans.
- **Premium tier for architects and contractors** — multi-client dashboard, design override tools, white-label exports.
- **Supplier lead-generation fees** for priority placement — clearly labelled, never disguised as an AI recommendation.

TRUST LEVERS — THE SAME LIST, FROM THE OTHER SIDE

Confidence scores and reasoning drawers everywhere; version history across the whole Design Studio; SKU-linked renders where what you see is what ships; transparent labour, GST and contingency lines; verified-supplier badges; and visible order and installation tracking after checkout. Every monetization lever above depends on one of these — take-rate on trusted prices, referrals on transparent totals, premium tools on preserved versions.

WHY IT MATTERS

Monetization and trust are not in tension here — they are the same primitives read in two directions. A platform that shows its reasoning earns the transaction; a platform that hides it earns exactly one.

IMPLEMENTATION ROADMAP — FIVE PHASES, 0–12 MONTHS

PHASE	WINDOW	DELIVERS
1 · Foundation	0–2 mo	Project/version data model, design-system tokens and shared trust components, resumable Brief
2 · Explainable Core Loop	2–4 mo	Layout scoring with real reasoning, Estimate tiers, live cost-delta feedback in Visualize
3 · Collaboration	4–6 mo	Comments, approvals, multi-role access, contractor/supplier hub MVP
4 · Marketplace Depth	6–9 mo	Live inventory and lead time, EMI/financing, installation scheduling, order tracking
5 · Scale & Intelligence	9–12 mo	AR/VR walkthrough, structural overlay from OCR, savings / carbon / maintenance analytics
